GUI vs CLI

When looking at GUI and CLI it became evident that they both could do basically the same things. Creating folders, files, editing some permissions, and names at the least. However what I noticed was the difference in how they were approached, GUI was much more visually based. With you seeing different folders and files and having it laid out in a way that gave you some form of a visual map. While CLI was more textbased and required more understanding of what was happening to feel oriented in where you were. This also played into how CLI seemed to be more fluid than GUI. This is to say once I became more familiar with parts of CLI it felt way faster to create files and folders. Even editing them felt more fluid as it was just an extension of CLI as opposed to opening something separate. I also found that while GUI is much easier and intuitive CLI was in some ways more fun. Perhaps this was due to the text that was explaining commands as spells, but it was much more satisfying to finish something in CLI.
